

Determining Potential to Emit for Oil & Gas Facilities

– Consideration of Product to Pipeline

The Department has determined that oil and gas well production that is routed to the pipeline would not be considered in the Potential to Emit (PTE) calculations. However, those emissions from process equipment (dehydrators, separators, heater treaters, tanks, truck load-out, etc.) and the secondary product recovered from process equipment (regardless of whether the secondary product is routed to a pipeline or not) must be considered in the PTE calculations. The PTE calculations must be made based on no controls and the maximum capacity of the equipment.
